# Why V2G Fleet

Four structural reasons fleet operators and grid partners are signing on — beyond the obvious revenue.

💶

E C O N O M I C S

### Revenue without disruption

Idle batteries become a revenue stream — without changing how the fleet operates. We optimize only the hours cars sit at the depot.

**+ 3–8 €**
per car per day

**Zero**
operational change

🛡️

T R U S T

### Fleet operation is sacred

SoC buffer is a contractual guarantee. The car is full when the driver arrives. Unplanned trips are absorbed automatically by the algorithm.

**100 %**
tour availability

**OEM-warrantied**
battery health

🌐

G R I D

### Critical infrastructure role

Available as emergency aggregator: when the TSO calls, our fleet pool dispatches in seconds. Replacing what gas peakers do today.

**< 30 s**
FCR response time

**Carbon-free**
vs. gas peaker

🇪🇺

T I M I N G

### Position before the wave

ISO 15118-20 makes bidirectional charging mandatory across the EU in January 2027. Fleets onboarded now own the market when it opens.

**Jan 2027**
EU mandate

**First-mover**
advantage

*Each reason addresses a distinct decision-maker — operations, finance, grid stability, strategic positioning.*

# For Fleet Operators

What changes when your fleet joins the platform — and what stays exactly the same.

## ↗ What changes

New value created by participating

- **New revenue line**

  5–25 % reduction in total cost of ownership through arbitrage, FCR availability and negative-price bonuses.

- **Lower electricity bill**

  Peak-shaving at the depot reduces your maximum kW peak — directly cuts the demand charge in your power contract.

- **Sustainability reporting**

  Verified $CO_2$ avoidance per fleet — useful for ESG reports, public-sector tenders, and customer disclosures.

- **Future-readiness**

  When ISO 15118-20 becomes mandatory in 2027, your fleet is already integrated. No catch-up costs.

## ✓ What stays the same

Your operations are untouched

- **Tour schedules**

  Drivers see no difference. Tours leave on time, with the SoC level you specify in the contract.

- **Vehicle warranty**

  Hyundai, Kia and Skoda warranty stays valid — 70 % capacity guaranteed for 8 years / 160,000 km.

- **Charging hardware**

  Use the bidirectional wallboxes your fleet will buy anyway from 2026 onward. We don't replace your CPO.

- **Driver behavior**

  No training needed, no app installation per driver. The plug stays the plug.

***Net effect: identical operations, additional revenue, verified sustainability.***

# For Grid Operators & Utilities

Three system-level capabilities that today require expensive backup infrastructure.

## Local flexibility

**↓ Transmission load**
Frankfurt absorbs Frankfurt's solar

- Solar generated mid-day is stored where it's produced — not routed through congested North-South transmission lines.
- Reduces the need for €billion grid expansion in regions like Hessen and Bavaria.
- DSO benefits: lower congestion at the local substation level.

## Emergency aggregator

**< 30 seconds**
From idle to full discharge

- Acts as carbon-free reserve power when the TSO reports frequency deviation — instantly.
- Replaces the role gas peakers play today, at lower marginal cost and zero $CO_2$.
- 12 GW of new gas plants are planned (EU-approved Jan 2026) — we reduce that need.

## Predictable flexibility

**Aggregated pools**
Heterogeneous fleets = reliable supply

- Single fleets have noisy availability profiles. Mixed fleets — logistics + workplace + municipal — average out into a predictable pool.
- Reaches the 1 MW FCR threshold by aggregation, not by waiting for a giant fleet.
- Tradable as one block via BKV partner — clean handoff to your existing systems.

# For Germany & the Energy Transition

V2G is not optional for the Energiewende — it's structurally required. We build the infrastructure layer.

THE BIGGER PICTURE

## Germany doesn't have an energy problem. It has a flexibility problem.

| | |
|---|---|
| **573 h** | Hours of negative prices in 2025 — wasted clean energy |
| **12 GW** | New gas plants approved Jan 2026 — to replace what we could store |
| **Jan 2027** | EU mandate makes bidirectional charging the default |

### Maximizes renewables already built

Solar and wind produced at the wrong time is currently curtailed or sold at negative prices. We capture this energy locally — no new generation needed.

### Reduces public infrastructure spending

Every MW of distributed storage avoids building new gas peakers, new transmission lines, and new utility-scale battery sites — all funded with grid fees and taxes.

### European industrial leadership

EU regulation (ISO 15118-20) creates the global standard for bidirectional charging. Companies building this layer in Germany now will scale across the EU.

***Joining V2G Fleet is not just an economic decision — it's a commitment to functional infrastructure for the next decade.***
